

# MySQL Tutorial

MySQL is a widely used relational database management system (RDBMS).

MySQL is free and open-source.

MySQL is ideal for both small and large applications.

# Introduction to MySQL

MySQL is a very popular open-source relational database management system (RDBMS).

---

## What is MySQL?

- MySQL is a relational database management system
  - MySQL is open-source
  - MySQL is free
  - MySQL is ideal for both small and large applications
  - MySQL is very fast, reliable, scalable, and easy to use
  - MySQL is cross-platform
  - MySQL is compliant with the ANSI SQL standard
  - MySQL was first released in 1995
  - MySQL is developed, distributed, and supported by Oracle Corporation
  - MySQL is named after co-founder Monty Widenius's daughter: My
- 

## Who Uses MySQL?

- Huge websites like Facebook, Twitter, Airbnb, Booking.com, Uber, GitHub, YouTube, etc.
  - Content Management Systems like WordPress, Drupal, Joomla!, Contao, etc.
  - A very large number of web developers around the world
- 

## Show Data On Your Web Site

To build a web site that shows data from a database, you will need:

- An RDBMS database program (like MySQL)
- A server-side scripting language, like PHP
- To use SQL to get the data you want
- To use HTML / CSS to style the page

# MySQL RDBMS

## What is RDBMS?

RDBMS stands for Relational Database Management System.

RDBMS is a program used to maintain a relational database.

RDBMS is the basis for all modern database systems such as MySQL, Microsoft SQL Server, Oracle, and Microsoft Access.

RDBMS uses [SQL queries](#) to access the data in the database.

---

## What is a Database Table?

A table is a collection of related data entries, and it consists of columns and rows.

A column holds specific information about every record in the table.

A record (or row) is each individual entry that exists in a table.

Look at a selection from the Northwind "Customers" table:

CustomerID	CustomerName	ContactName	Address	City	PostalCode	Country
1	Alfreds Futterkiste	Maria Anders	Obere Str. 57	Berlin	12209	Germany
2	Ana Trujillo Emparedados y helados	Ana Trujillo	Avda. de la Constitución 2222	México D.F.	05021	Mexico
3	Antonio Moreno Taquería	Antonio Moreno	Mataderos 2312	México D.F.	05023	Mexico
4	Around the Horn	Thomas Hardy	120 Hanover Sq.	London	WA1 1DP	UK
5	Berglunds snabbköp	Christina Berglund	Berguvsvägen 8	Luleå	S-958 22	Sweden

The columns in the "Customers" table above are: CustomerID, CustomerName, ContactName, Address, City, PostalCode and Country. The table has 5 records (rows).

## What is a Relational Database?

A relational database defines database relationships in the form of tables. The tables are related to each other - based on data common to each.

Look at the following three tables "Customers", "Orders", and "Shippers" from the Northwind database:

Customers Table

CustomerID	CustomerName	ContactName	Address	City	PostalCode	Country
1	Alfreds Futterkiste	Maria Anders	Obere Str. 57	Berlin	12209	Germany
2	Ana Trujillo Emparedados y helados	Ana Trujillo	Avda. de la Constitución 2222	México D.F.	05021	Mexico
3	Antonio Moreno Taquería	Antonio Moreno	Mataderos 2312	México D.F.	05023	Mexico
4	Around the Horn	Thomas Hardy	120 Hanover Sq.	London	WA1 1DP	UK
5	Berglunds snabbköp	Christina Berglund	Berguvsvägen 8	Luleå	S-958 22	Sweden

The relationship between the "Customers" table and the "Orders" table is the CustomerID column:

Orders Table

OrderID	CustomerID	EmployeeID	OrderDate	ShipperID
10278	5	8	1996-08-12	2
10280	5	2	1996-08-14	1
10308	2	7	1996-09-18	3
10355	4	6	1996-11-15	1
10365	3	3	1996-11-27	2
10383	4	8	1996-12-16	3
10384	5	3	1996-12-16	3

The relationship between the "Orders" table and the "Shippers" table is the ShipperID column:

Shippers Table

ShipperID	ShipperName	Phone
1	Speedy Express	(503) 555-9831

**2** United Package (503) 555-3199

**3** Federal Shipping (503) 555-9931

# MySQL SQL

## What is SQL?

SQL is the standard language for dealing with Relational Databases.

SQL is used to insert, search, update, and delete database records.

---

## How to Use SQL

The following SQL statement selects all the records in the "Customers" table:

Example

```
SELECT * FROM Customers;
```

## Keep in Mind That...

- SQL keywords are NOT case sensitive: `select` is the same as `SELECT`

In this tutorial we will write all SQL keywords in upper-case.

---

## Semicolon after SQL Statements?

Some database systems require a semicolon at the end of each SQL statement.

Semicolon is the standard way to separate each SQL statement in database systems that allow more than one SQL statement to be executed in the same call to the server.

In this tutorial, we will use semicolon at the end of each SQL statement.

---

## Some of The Most Important SQL Commands

- `SELECT` - extracts data from a database
- `UPDATE` - updates data in a database
- `DELETE` - deletes data from a database
- `INSERT INTO` - inserts new data into a database
- `CREATE DATABASE` - creates a new database
- `ALTER DATABASE` - modifies a database
- `CREATE TABLE` - creates a new table
- `ALTER TABLE` - modifies a table

- DROP TABLE - deletes a table
- CREATE INDEX - creates an index (search key)
- DROP INDEX - deletes an index

Create Database and table as following

Server: 127.0.0.1 » Database: khushi » Table: students

BrowseStructureSQLSearchInsertExportImportPrivilegesOperationsTrackingTriggers

Table structureRelation view

#	Name	Type	Collation	Attributes	Null	Default	Comments	Extra	Action
<input type="checkbox"/>	1 id	int(11)			No	None		AUTO_INCREMENT	
<input type="checkbox"/>	2 fname	varchar(32)	utf8mb4_general_ci		No	None			
<input type="checkbox"/>	3 lname	varchar(32)	utf8mb4_general_ci		No	None			
<input type="checkbox"/>	4 city	varchar(32)	utf8mb4_general_ci		No	None

# MySQL SELECT Statement

## The MySQL SELECT Statement

The `SELECT` statement is used to select data from a database.

The data returned is stored in a result table, called the result-set.

### SELECT Syntax

`SELECT column1, column2, ... FROM table_name;`

`SELECT id, fname, lname FROM students`

Here, column1, column2, ... are the field names of the table you want to select data from. If you want to select all the fields available in the table, use the following syntax:

`SELECT * FROM table_name;`

`SELECT * FROM students;`

## The MySQL SELECT DISTINCT Statement

The `SELECT DISTINCT` statement is used to return only distinct (different) values.

Inside a table, a column often contains many duplicate values; and sometimes you only want to list the different (distinct) values.

### SELECT DISTINCT Syntax

`SELECT DISTINCT column1, column2, ... FROM table_name;`

`SELECT DISTINCT(city) FROM students`

## SELECT Example Without DISTINCT

The following SQL statement selects all (including the duplicates) values from the "Country" column in the "Customers" table:

`SELECT COUNT(DISTINCT(city)) FROM students`

# MySQL WHERE Clause

## The MySQL WHERE Clause

The `WHERE` clause is used to filter records.

It is used to extract only those records that fulfill a specified condition.

### WHERE Syntax

`SELECT column1, column2, ... FROM table_name WHERE condition;`

**Note:** The `WHERE` clause is not only used in `SELECT` statements, it is also used in `UPDATE`, `DELETE`, etc.!

```
SELECT * FROM students WHERE city = 'Rajkot'
```

```
SELECT id, fname, lname, city FROM students WHERE city = 'Rajkot';
```

### Text Fields vs. Numeric Fields

SQL requires single quotes around text values (most database systems will also allow double quotes).

However, numeric fields should not be enclosed in quotes:

```
SELECT id, fname, lname, city FROM students WHERE id > 5
```

```
SELECT id, fname, lname, city FROM students WHERE id = 5;
```

```
SELECT id, fname, lname, city FROM students WHERE id >= 5;
```

```
SELECT id, fname, lname, city FROM students WHERE id < 5;
```

```
SELECT id, fname, lname, city FROM students WHERE id <= 5;
```

```
SELECT id, fname, lname, city FROM students WHERE id <> 5;
```

```
SELECT id, fname, lname, city FROM students WHERE not id = 5;
```

# MySQL AND, OR and NOT Operators

## The MySQL AND, OR and NOT Operators

The `WHERE` clause can be combined with `AND`, `OR`, and `NOT` operators.

The `AND` and `OR` operators are used to filter records based on more than one condition:

- The `AND` operator displays a record if all the conditions separated by `AND` are `TRUE`.
- The `OR` operator displays a record if any of the conditions separated by `OR` is `TRUE`.

The `NOT` operator displays a record if the condition(s) is `NOT TRUE`.

### AND Syntax

```
SELECT column1, column2, ... FROM table_name WHERE condition1 AND condition2 AND condition3 ...;
```

### OR Syntax

```
SELECT column1, column2, ... FROM table_name WHERE condition1 OR condition2 OR condition3 ...;
```

### NOT Syntax

```
SELECT column1, column2, ... FROM table_name WHERE NOT condition;
```

```
SELECT * FROM students WHERE id = 1
```

```
SELECT * FROM students WHERE id = 1 and city = 'Surat';
```

```
SELECT * FROM students WHERE id = 1 or city = 'Surat';
```

```
SELECT * FROM students WHERE not city = 'Surat';
```

## Combining AND, OR and NOT

You can also combine the `AND`, `OR` and `NOT` operators.

```
SELECT * FROM students WHERE id = 1 and city = 'Rajkot' or city = 'Surat';
```

```
SELECT * FROM students WHERE id = 1 and (city = 'Rajkot' or city = 'Surat');
```

```
SELECT * FROM students WHERE id = 1 and (not city = 'Rajkot' and not city = 'Surat');
```

# MySQL ORDER BY Keyword

## The MySQL ORDER BY Keyword

The `ORDER BY` keyword is used to sort the result-set in ascending or descending order.

The `ORDER BY` keyword sorts the records in ascending order by default. To sort the records in descending order, use the `DESC` keyword.

### ORDER BY Syntax

```
SELECT column1, column2, ... FROM table_name ORDER BY column1, column2, ... ASC|DESC;
```

```
SELECT * FROM students
```

```
SELECT * FROM students ORDER by (fname);
```

```
SELECT * FROM students ORDER by (fname) DESC;
```

### ORDER BY Several Columns Example

```
SELECT * FROM students ORDER by fname, city;
```

```
SELECT * FROM students ORDER by fname asc, city DESC;
```

# MySQL INSERT INTO Statement

## The MySQL INSERT INTO Statement

The `INSERT INTO` statement is used to insert new records in a table.

### INSERT INTO Syntax

It is possible to write the `INSERT INTO` statement in two ways:

1. Specify both the column names and the values to be inserted:

```
INSERT INTO table_name (column1, column2, column3, ...) VALUES (value1, value2, value3, ...);
```

2. If you are adding values for all the columns of the table, you do not need to specify the column names in the SQL query. However, make sure the order of the values is in the same order as the columns in the table. Here, the `INSERT INTO` syntax would be as follows:

```
INSERT INTO table_name VALUES (value1, value2, value3, ...);
```

```
INSERT into students (fname, lname, city, gender, dob, email, phone) VALUES ('Dhruvisha', 'Bhatt', 'Junagadh', 'female', '2008-09-09', 'dhruvisha@gmail.com', '9900999999')
```

**Did you notice that we did not insert any number into the CustomerID field?**

The CustomerID column is an **auto-increment** field and will be **generated automatically** when a new record is inserted into the table.

### Insert Data Only in Specified Columns

It is also possible to only insert data in specific columns.

```
INSERT into students (fname, lname) VALUES ('Devangi', 'Dave')
```

Warning: #1364 Field 'city' doesn't have a default value

Warning: #1364 Field 'gender' doesn't have a default value

Warning: #1364 Field 'dob' doesn't have a default value

Warning: #1364 Field 'email' doesn't have a default value

Warning: #1364 Field 'phone' doesn't have a default value

# MySQL NULL Values

## What is a NULL Value?

A field with a NULL value is a field with no value.

If a field in a table is optional, it is possible to insert a new record or update a record without adding a value to this field. Then, the field will be saved with a NULL value.

**Note:** A NULL value is different from a zero value or a field that contains spaces. A field with a NULL value is one that has been left blank during record creation!

## How to Test for NULL Values?

It is not possible to test for NULL values with comparison operators, such as =, <, or <>.

We will have to use the `IS NULL` and `IS NOT NULL` operators instead.

```
SELECT * FROM `students` WHERE city is null
```

```
SELECT * FROM `students` WHERE city = "";
```

```
ALTER TABLE `students` CHANGE `city` `city` VARCHAR(32) NULL;
```

```
SELECT * FROM `students` WHERE city is null
```

```
SELECT * FROM `students` WHERE city is not null;
```

## The IS NULL Operator

The `IS NULL` operator is used to test for empty values (NULL values).

## The IS NOT NULL Operator

The `IS NOT NULL` operator is used to test for non-empty values (NOT NULL values).

# MySQL UPDATE Statement

## The MySQL UPDATE Statement

The `UPDATE` statement is used to modify the existing records in a table.

UPDATE Syntax

```
UPDATE table_name SET column1 = value1, column2 = value2, ... WHERE condition;
```

**Note:** Be careful when updating records in a table! Notice the `WHERE` clause in the `UPDATE` statement. The `WHERE` clause specifies which record(s) that should be updated. If you omit the `WHERE` clause, all records in the table will be updated!

`UPDATE students set gender = 'Female'`

`UPDATE students set city = 'Rajkot' WHERE id = 10`

`UPDATE Multiple Records`

It is the `WHERE` clause that determines how many records will be updated.

`UPDATE students set city = 'Rajkot', gender = 'female', phone = '9998887770' WHERE id = 10;`

`Update Warning!`

Be careful when updating records. If you omit the `WHERE` clause, ALL records will be updated!

# MySQL LIMIT Clause

## The MySQL LIMIT Clause

The `LIMIT` clause is used to specify the number of records to return.

The `LIMIT` clause is useful on large tables with thousands of records. Returning a large number of records can impact performance.

### LIMIT Syntax

```
SELECT * FROM students
```

```
SELECT * FROM students LIMIT 5;
```

```
SELECT * FROM students LIMIT 5 OFFSET 5;
```

```
SELECT * FROM students LIMIT 10, 5;
```

## MySQL LIMIT Examples

The following SQL statement selects the first three records from the "Customers" table:

Example

```
SELECT * FROM Customers LIMIT 3;
```

What if we want to select records 4 - 6 (inclusive)?

MySQL provides a way to handle this: by using `OFFSET`.

The SQL query below says "return only 3 records, start on record 4 (`OFFSET 3`)":

Example

```
SELECT * FROM Customers LIMIT 3 OFFSET 3;
```

```
SELECT * from students WHERE city = 'Ahemdabad';
```

```
SELECT * from students WHERE city = 'Ahemdabad' LIMIT 2;
```

# MySQL MIN() and MAX() Functions

## MySQL MIN() and MAX() Functions

The `MIN()` function returns the smallest value of the selected column.

The `MAX()` function returns the largest value of the selected column.

### MIN() Syntax

```
SELECT MIN(column_name) FROM table_name WHERE condition;
```

### MAX() Syntax

```
SELECT MAX(column_name) FROM table_name WHERE condition;
```

```
SELECT min(dob) FROM students;
```

```
SELECT max(dob) FROM students;
```

```
SELECT MAX(id) FROM students
```

```
SELECT min(id) FROM students;
```

---

```
SELECT MIN(dob) FROM students;
```

```
SELECT MIN(dob) as "Oldest Student" FROM students;
```

```
SELECT MAX(dob) as "Youngest Student" FROM students;
```

# MySQL COUNT(), AVG() and SUM() Functions

## MySQL COUNT(), AVG() and SUM() Functions

The `COUNT ()` function returns the number of rows that matches a specified criterion.

COUNT() Syntax

```
SELECT COUNT(column_name) FROM table_name WHERE condition;
```

The `AVG ()` function returns the average value of a numeric column.

AVG() Syntax

```
SELECT AVG(column_name) FROM table_name WHERE condition;
```

The `SUM ()` function returns the total sum of a numeric column.

SUM() Syntax

```
SELECT SUM(column_name) FROM table_name WHERE condition;
```

```
SELECT COUNT(id) FROM students
```

```
SELECT COUNT(id) FROM students WHERE city = 'Ahamdabad';
```

```
SELECT COUNT(id) FROM students WHERE city <> 'Ahamdabad';
```

```
SELECT sum(id) FROM students
```

```
SELECT avg(id) FROM students
```

# MySQL LIKE Operator

The `LIKE` operator is used in a `WHERE` clause to search for a specified pattern in a column.

There are two wildcards often used in conjunction with the `LIKE` operator:

- The percent sign (%) represents zero, one, or multiple characters
- The underscore sign (\_) represents one, single character

The percent sign and the underscore can also be used in combinations!

## LIKE Syntax

`SELECT column1, column2, ... FROM table_name WHERE columnN LIKE pattern;`

**Tip:** You can also combine any number of conditions using `AND` or `OR` operators.

`SELECT * from students WHERE fname like 'k%'`

`SELECT * from students WHERE fname like '%k';`

`SELECT * from students WHERE fname like '%k%';`

`SELECT * from students WHERE fname like 'a%';`

`SELECT * from students WHERE fname like '_a%';`

Here are some examples showing different `LIKE` operators with '%' and '\_' wildcards:

LIKE Operator	Description
<code>WHERE CustomerName LIKE 'a%'</code>	Finds any values that start with "a"
<code>WHERE CustomerName LIKE '%a'</code>	Finds any values that end with "a"
<code>WHERE CustomerName LIKE '%or%'</code>	Finds any values that have "or" in any position
<code>WHERE CustomerName LIKE '_r%'</code>	Finds any values that have "r" in the second position
<code>WHERE CustomerName LIKE 'a_%'</code>	Finds any values that start with "a" and are at least 2 characters in length
<code>WHERE CustomerName LIKE 'a__%'</code>	Finds any values that start with "a" and are at least 3 characters in length
<code>WHERE ContactName LIKE 'a%o'</code>	Finds any values that start with "a" and ends with "o"

`SELECT * from students WHERE fname like 'p%a';`

```
SELECT * from students WHERE fname like 'a____';
```

```
SELECT * from students WHERE fname like 'a____%';
```

```
SELECT * from students WHERE fname not like 'a%';
```

# MySQL Wildcards

## MySQL Wildcard Characters

A wildcard character is used to substitute one or more characters in a string.

Wildcard characters are used with the [LIKE](#) operator. The `LIKE` operator is used in a `WHERE` clause to search for a specified pattern in a column.

## Wildcard Characters in MySQL

Symbol	Description	Example
%	Represents zero or more characters	bl% finds bl, black, blue, and blob
_	Represents a single character	h_t finds hot, hat, and hit

The wildcards can also be used in combinations!

Here are some examples showing different `LIKE` operators with '%' and '\_' wildcards:

# MySQL IN Operator

## The MySQL IN Operator

The `IN` operator allows you to specify multiple values in a `WHERE` clause.

The `IN` operator is a shorthand for multiple `OR` conditions.

### IN Syntax

```
SELECT column_name(s) FROM table_name WHERE column_name IN (value1, value2, ...);
```

```
SELECT * from students WHERE city = 'surat' or city = 'Rajkot' or city = 'Ahamdabad'
```

```
SELECT * from students WHERE city in('surat', 'Rajkot', 'Ahamdabad');
```

```
SELECT * from students WHERE city not in('surat', 'Rajkot', 'Ahamdabad');
```

# MySQL BETWEEN Operator

## The MySQL BETWEEN Operator

The `BETWEEN` operator selects values within a given range. The values can be numbers, text, or dates.

The `BETWEEN` operator is inclusive: begin and end values are included.

### BETWEEN Syntax

`SELECT column_name(s) FROM table_name WHERE column_name BETWEEN value1 AND value2;`

`SELECT * from students WHERE id BETWEEN 1 and 5;`

`SELECT * from students WHERE dob BETWEEN '2000-01-01' and '2007-12-31';`

`SELECT * from students WHERE fname BETWEEN 'arti' and 'palak'`

`SELECT * from students WHERE fname not BETWEEN 'arti' and 'palak';`

# MySQL Aliases

## MySQL Aliases

Aliases are used to give a table, or a column in a table, a temporary name.

Aliases are often used to make column names more readable.

An alias only exists for the duration of that query.

An alias is created with the `AS` keyword.

### Alias Column Syntax

```
SELECT column_name AS alias_name FROM table_name;
```

### Alias Table Syntax

```
SELECT column_name(s) FROM table_name AS alias_name;
```

```
SELECT fname as "First Name", lname as "Last Name" from students;
```

The following SQL statement creates two aliases, one for the CustomerName column and one for the ContactName column. **Note:** Single or double quotation marks are required if the alias name contains spaces:

```
SELECT id as ID, fname as "First Name", lname as "Last Name" from students;
```

```
SELECT id as "Student ID", fname as "First Name", lname as "Last Name" from students;
```

```
SELECT concat_ws(" ", id, fname, lname, city, email, phone, dob) as "Student Details" FROM students;
```

```
SELECT concat_ws(" _ ", id, fname, lname, city, email, phone, dob) as "Student Details" FROM students;
```

### Alias for Tables Example

```
SELECT students.id, students.fname, students.lname, students.city, students.gender, students.dob, students.email, students.phone, attendance.absents, attendance.presents from students, attendance
```

```
SELECT students.id, students.fname, students.lname, students.city, students.gender, students.dob, students.email, students.phone, attendance.absents, attendance.presents from students, attendance WHERE students.id = attendance.stduent_id;
```

```
SELECT s.id, s.fname, s.lname, s.city, s.gender, s.dob, s.email, s.phone, a.absents, a.presents from students s, attendance a WHERE s.id = a.stduent_id;
```

Aliases can be useful when:

- There are more than one table involved in a query
- Functions are used in the query
- Column names are big or not very readable
- Two or more columns are combined together

```
SELECT COUNT(id) FROM students WHERE city = 'Rajkot';
```

```
SELECT COUNT(id) as "Students From Rajkot" FROM students WHERE city = 'Rajkot';
```

# MySQL Joins

## MySQL Joining Tables

A `JOIN` clause is used to combine rows from two or more tables, based on a related column between them.

```
SELECT students.*, attendance.absents, attendance.presents from students INNER join attendance
```

```
SELECT students.*, attendance.absents, attendance.presents from students INNER join attendance on  
students.id = attendance.stduent_id;
```

## Supported Types of Joins in MySQL

- `INNER JOIN`: Returns records that have matching values in both tables
- `LEFT JOIN`: Returns all records from the left table, and the matched records from the right table
- `RIGHT JOIN`: Returns all records from the right table, and the matched records from the left table
- `CROSS JOIN`: Returns all records from both tables

# MySQL INNER JOIN Keyword

## MySQL INNER JOIN Keyword

The `INNER JOIN` keyword selects records that have matching values in both tables.

### INNER JOIN Syntax

```
SELECT column_name(s) FROM table1 INNER JOIN table2 ON table1.column_name =  
table2.column_name;
```

```
SELECT students.id, students.fname, students.lname, students.city, students.gender, students.dob,  
students.email, students.phone, attendance.absents, attendance.presents from students INNER JOIN  
attendance on students.id = attendance.stduent_id
```

**Note:** The `INNER JOIN` keyword selects all rows from both tables as long as there is a match between the columns. If there are records in the "Orders" table that do not have matches in "Customers", these orders will not be shown!

### JOIN Three Tables

```
SELECT students.id, students.fname, students.lname, students.city, students.gender, students.dob,  
students.email, students.phone, attendance.absents, attendance.presents, marks.total, marks.result  
from students INNER JOIN attendance on students.id = attendance.stduent_id INNER JOIN marks on  
students.id = marks.stduent_id;
```

```
SELECT s.id, s.fname, s.lname, s.city, s.gender, s.dob, s.email, s.phone, a.absents, a.presents, m.total,  
m.result from students s INNER join attendance a on s.id = a.stduent_id INNER join marks m on s.id =  
m.stduent_id
```

# MySQL LEFT JOIN Keyword

## MySQL LEFT JOIN Keyword

The `LEFT JOIN` keyword returns all records from the left table (table1), and the matching records (if any) from the right table (table2).

### LEFT JOIN Syntax

```
SELECT column_name(s) FROM table1 LEFT JOIN table2 ON table1.column_name =  
table2.column_name;
```

```
SELECT students.id, students.fname, students.lname, students.city, students.gender, students.dob,  
students.email, students.phone, attendance.absents, attendance.presents FROM students LEFT join  
attendance on students.id = attendance.stduent_id
```

**Note:** The `LEFT JOIN` keyword returns all records from the left table (Customers), even if there are no matches in the right table (Orders).

# MySQL RIGHT JOIN Keyword

## MySQL RIGHT JOIN Keyword

The `RIGHT JOIN` keyword returns all records from the right table (table2), and the matching records (if any) from the left table (table1).

### RIGHT JOIN Syntax

```
SELECT column_name(s) FROM table1 RIGHT JOIN table2 ON table1.column_name = table2.column_name;
```

```
SELECT students.id, students.fname, students.lname, students.city, students.gender, students.dob, students.email, students.phone, attendance.absents, attendance.presents FROM students RIGHT join attendance on students.id = attendance.stduent_id;
```

**Note:** The `RIGHT JOIN` keyword returns all records from the right table (Employees), even if there are no matches in the left table (Orders).

# MySQL CROSS JOIN Keyword

## SQL CROSS JOIN Keyword

The `CROSS JOIN` keyword returns all records from both tables (table1 and table2).

### CROSS JOIN Syntax

```
SELECT column_name(s) FROM table1 CROSS JOIN table2;
```

**Note:** `CROSS JOIN` can potentially return very large result-sets!

```
SELECT students.*, attendance.absents, attendance.presents FROM students CROSS JOIN attendance;
```

**Note:** The `CROSS JOIN` keyword returns all matching records from both tables whether the other table matches or not. So, if there are rows in "Customers" that do not have matches in "Orders", or if there are rows in "Orders" that do not have matches in "Customers", those rows will be listed as well.

If you add a `WHERE` clause (if table1 and table2 has a relationship), the `CROSS JOIN` will produce the same result as the `INNER JOIN` clause:

```
SELECT students.*, attendance.absents, attendance.presents FROM students CROSS JOIN attendance  
WHERE students.id = attendance.student_id;
```

# MySQL Self Join

## MySQL Self Join

A self join is a regular join, but the table is joined with itself.

### Self Join Syntax

**SELECT** *column\_name(s)* **FROM** *table1 T1, table1 T2* **WHERE** *condition*;

*T1* and *T2* are different table aliases for the same table.

```
SELECT s1.id, s1.fname, s1.lname, s1.city FROM students s1, students s2 WHERE s1.city = s2.city and  
s1.id <> s2.id;
```

```
SELECT s1.id, s1.fname, s1.lname, s1.city FROM students s1, students s2 WHERE s1.city = s2.city and  
s1.id <> s2.id ORDER by s1.city;
```

## The MySQL UNION Operator

The `UNION` operator is used to combine the result-set of two or more `SELECT` statements.

- Every `SELECT` statement within `UNION` must have the same number of columns
- The columns must also have similar data types
- The columns in every `SELECT` statement must also be in the same order

```
SELECT * FROM students WHERE City = 'Rajkot'
```

```
SELECT * FROM students_1 WHERE City = 'surat';
```

---

```
SELECT * FROM students WHERE City = 'rajkot'
```

```
UNION
```

```
SELECT * FROM students_1 WHERE City = 'surat';
```

---

```
SELECT * FROM students WHERE City = 'rajkot'
```

```
UNION
```

```
SELECT * FROM students_1 WHERE City = 'rajkot';
```

## UNION ALL Syntax

The `UNION` operator selects only distinct values by default. To allow duplicate values, use `UNION ALL`:

```
SELECT column_name(s) FROM table1 UNION ALL SELECT column_name(s) FROM table2;
```

**Note:** The column names in the result-set are usually equal to the column names in the first `SELECT` statement.

```
SELECT * FROM students WHERE City = 'rajkot'
```

```
UNION all
```

```
SELECT * FROM students_1 WHERE City = 'rajkot';
```

# MySQL GROUP BY Statement

## The MySQL GROUP BY Statement

The `GROUP BY` statement groups rows that have the same values into summary rows, like "find the number of customers in each country".

The `GROUP BY` statement is often used with aggregate functions (`COUNT()`, `MAX()`, `MIN()`, `SUM()`, `AVG()`) to group the result-set by one or more columns.

### GROUP BY Syntax

`SELECT column_name(s) FROM table_name WHERE condition GROUP BY column_name(s) ORDER BY column_name(s);`

`SELECT city, COUNT(city) FROM student`

---

`SELECT city, COUNT(city) FROM students GROUP by (city)`

`SELECT city, COUNT(city) FROM students GROUP by (city) ORDER by COUNT(city);`

`SELECT city, COUNT(city) FROM students GROUP by (city) ORDER by COUNT(city) desc;`

---

`SELECT students.*, attendance.absents, attendance.presents,  
sum(attendance.absents+attendance.presents) as "Total Days" FROM students INNER join attendance  
on students.id = attendance.student_id GROUP by (students.id);`

# MySQL HAVING Clause

## The MySQL HAVING Clause

The `HAVING` clause was added to SQL because the `WHERE` keyword cannot be used with aggregate functions.

### HAVING Syntax

`SELECT column_name(s) FROM table_name WHERE condition GROUP BY column_name(s) HAVING condition ORDER BY column_name(s);`

`SELECT city, COUNT(id) FROM students GROUP by (city)`

`SELECT city, COUNT(id) FROM students GROUP by (city) WHERE count(id) >= 3;`

`SELECT city, COUNT(id) FROM students GROUP by (city) HAVING count(id) >= 3;`

# MySQL EXISTS Operator

## The MySQL EXISTS Operator

The `EXISTS` operator is used to test for the existence of any record in a subquery.

The `EXISTS` operator returns `TRUE` if the subquery returns one or more records.

### EXISTS Syntax

`SELECT column_name(s) FROM table_name WHERE EXISTS (SELECT column_name FROM table_name WHERE condition);`

`SELECT students.* FROM students where EXISTS (SELECT marks.stduent_id FROM marks WHERE marks.stduent_id = students.id and marks.result = 'pass');`

# MySQL ANY and ALL Operators

## The MySQL ANY and ALL Operators

The `ANY` and `ALL` operators allow you to perform a comparison between a single column value and a range of other values.

### The ANY Operator

The `ANY` operator:

- returns a boolean value as a result
- returns TRUE if ANY of the subquery values meet the condition

`ANY` means that the condition will be true if the operation is true for any of the values in the range.

ANY Syntax

```
SELECT column_name(s) FROM table_name WHERE column_name operator ANY (SELECT column_name FROM table_name WHERE condition);
```

**Note:** The *operator* must be a standard comparison operator (`=`, `<>`, `!=`, `>`, `>=`, `<`, or `<=`).

---

### The ALL Operator

The `ALL` operator:

- returns a boolean value as a result
- returns TRUE if ALL of the subquery values meet the condition
- is used with `SELECT`, `WHERE` and `HAVING` statements

`ALL` means that the condition will be true only if the operation is true for all values in the range.

ALL Syntax With SELECT

```
SELECT ALL column_name(s) FROM table_name WHERE condition;
```

```
SELECT students.id, students.fname, students.lname FROM students WHERE id = any (SELECT marks.stduent_id from marks WHERE marks.result = 'fail')
```

### SQL ALL Examples

The following SQL statement lists ALL the product names:

```
SELECT * from students WHERE true;
```

```
SELECT all fname from students WHERE true;
```

```
SELECT fname, lname FROM students WHERE id = all (SELECT marks.stduent_id from marks WHERE  
marks.result = 'fail');
```

```
SELECT students.* from students WHERE id = all (SELECT attendance.stduent_id  
FROM attendance WHERE attendance.absents = 150);
```

# MySQL INSERT INTO SELECT Statement

The `INSERT INTO SELECT` statement copies data from one table and inserts it into another table.

The `INSERT INTO SELECT` statement requires that the data types in source and target tables matches.

**Note:** The existing records in the target table are unaffected.

## INSERT INTO SELECT Syntax

Copy all columns from one table to another table:

```
INSERT INTO students_1 (fname, lname, city, email, phone, gender, dob) SELECT fname, lname, city, email, phone, gender, dob FROM students WHERE City = 'Rajkot'
```

```
INSERT INTO table2 SELECT * FROM table1 WHERE condition;
```

Copy only some columns from one table into another table:

```
INSERT INTO table2 (column1, column2, column3, ...) SELECT column1, column2, column3, ... FROM table1 WHERE condition;
```

# MySQL CASE Statement

## The MySQL CASE Statement

The `CASE` statement goes through conditions and returns a value when the first condition is met (like an if-then-else statement). So, once a condition is true, it will stop reading and return the result. If no conditions are true, it returns the value in the `ELSE` clause.

If there is no `ELSE` part and no conditions are true, it returns `NULL`.

### CASE Syntax

#### CASE

```
WHEN condition1 THEN result1
WHEN condition2 THEN result2
WHEN conditionN THEN resultN
ELSE result
END;
```

```
SELECT id, fname, lname, city, email, phone, gender, dob from students
```

```
SELECT id, fname, lname, city, case
```

```
    WHEN city = 'Rajkot' THEN 'Home Town'
```

```
    WHEN city = 'Ahamdabad' THEN 'Far From Home'
```

```
    WHEN city = 'Surat' THEN 'Too much Far From Home'
```

```
end as "Distance From Home", email, phone, gender, dob from students;
```

---

```
SELECT id, fname, lname, city, case
```

```
    WHEN city = 'Rajkot' THEN 'Home Town'
```

```
    WHEN city = 'Ahamdabad' THEN 'Far From Home'
```

```
    WHEN city = 'Surat' THEN 'Too much Far From Home'
```

```
    else 'Unkonwn Distance'
```

```
end as "Distance From Home", email, phone, gender, dob from students;
```

# MySQL NULL Functions

## MySQL IFNULL() and COALESCE() Functions

### MySQL IFNULL() Function

The MySQL [IFNULL\(\)](#) function lets you return an alternative value if an expression is NULL.

The example below returns 0 if the value is NULL:

```
SELECT stduent_id, absents, presents from attendance
```

```
SELECT stduent_id, absents, presents, (absents + presents) as "Total Working Days" from attendance;
```

```
SELECT stduent_id, absents, presents, (absents + presents) as "Total Working Days" from attendance;
```

```
SELECT stduent_id, absents, presents, (ifnull(absents,0) + ifnull(presents, 0)) as "Total Working Days" from attendance;
```

### MySQL COALESCE() Function

Or we can use the [COALESCE\(\)](#) function, like this:

```
SELECT stduent_id, absents, presents, (COALESCE(absents,0) + COALESCE(presents, 0)) as "Total Working Days" from attendance;
```

# MySQL Comments

## MySQL Comments

Comments are used to explain sections of SQL statements, or to prevent execution of SQL statements.

---

### Single Line Comments

Single line comments start with --.

Any text between -- and the end of the line will be ignored (will not be executed).

The following example uses a single-line comment as an explanation:

Example

```
-- Select all:  
SELECT * FROM Customers;
```

The following example uses a single-line comment to ignore the end of a line:

Example

```
SELECT * FROM Customers -- WHERE City='Berlin';
```

**-- COALESCE function replace null values with specified value**

```
SELECT student_id, absents, presents, (COALESCE(absents,0) + COALESCE(presents, 0)) as "Total Working Days" from attendance;
```

### Multi-line Comments

Multi-line comments start with /\* and end with \*/.

Any text between /\* and \*/ will be ignored.

The following example uses a multi-line comment as an explanation:

```
/*Select all the columns  
of all the records  
in the Customers table:*/  
SELECT * FROM Customers;
```

-- Example of Multiline / block comment

```
SELECT stduent_id, absents, presents /*,(COALESCE(absents,0) + COALESCE(presents, 0)) as "Total  
Working Days" */ from attendance;
```

# MySQL CREATE DATABASE Statement

## The MySQL CREATE DATABASE Statement

The `CREATE DATABASE` statement is used to create a new SQL database.

Syntax

`CREATE DATABASE databasename;`

`create database testdb`

**Tip:** Make sure you have admin privilege before creating any database. Once a database is created, you can check it in the list of databases with the following SQL command: `SHOW DATABASES;`

# MySQL DROP DATABASE Statement

## The MySQL DROP DATABASE Statement

The `DROP DATABASE` statement is used to drop an existing SQL database.

Syntax

`DROP DATABASE databasename;`

`DROP database testdb;`

**Note:** Be careful before dropping a database. Deleting a database will result in loss of complete information stored in the database!

**Tip:** Make sure you have admin privilege before dropping any database. Once a database is dropped, you can check it in the list of databases with the following SQL command: `SHOW DATABASES;`

`show DATABASES`

# MySQL CREATE TABLE Statement

## The MySQL CREATE TABLE Statement

The `CREATE TABLE` statement is used to create a new table in a database.

Syntax

```
CREATE TABLE table_name (  
    column1 datatype,  
    column2 datatype,  
    column3 datatype,  
    ....  
);
```

The column parameters specify the names of the columns of the table.

The datatype parameter specifies the type of data the column can hold (e.g. varchar, integer, date, etc.).

```
CREATE TABLE users (id int AUTO_INCREMENT PRIMARY key, fname varchar(20), lname varchar(20),  
email varchar(128), phone varchar(15), gender varchar(10), city varchar(20), state varchar(20), country  
varchar(20))
```

## Create Table Using Another Table

A copy of an existing table can also be created using `CREATE TABLE`.

The new table gets the same column definitions. All columns or specific columns can be selected.

If you create a new table using an existing table, the new table will be filled with the existing values from the old table.

Syntax

```
CREATE TABLE new_table_name AS  
    SELECT column1, column2,...  
    FROM existing_table_name  
    WHERE ....;
```

```
CREATE TABLE students_backup_1 as SELECT * from students
```

```
CREATE TABLE students_backup_2 as SELECT id, fname, lname, city from students
```

# MySQL DROP TABLE Statement

## The MySQL DROP TABLE Statement

The `DROP TABLE` statement is used to drop an existing table in a database.

Syntax

`DROP TABLE table_name;`

**Note:** Be careful before dropping a table. Deleting a table will result in loss of complete information stored in the table!

## MySQL DROP TABLE Example

The following SQL statement drops the existing table "Shippers":

Example

`DROP TABLE Shippers;`

`drop table students_backup_2`

# MySQL DELETE Statement

## The MySQL DELETE Statement

The `DELETE` statement is used to delete existing records in a table.

### DELETE Syntax

`DELETE FROM table_name WHERE condition;`

**Note:** Be careful when deleting records in a table! Notice the `WHERE` clause in the `DELETE` statement. The `WHERE` clause specifies which record(s) should be deleted. If you omit the `WHERE` clause, all records in the table will be deleted!

---

```
DELETE from students_1 WHERE city = 'Rajkot';
```

```
DELETE FROM students_1 WHERE id = 1
```

```
DELETE FROM students_1
```

---

```
INSERT INTO `students_1` (`id`, `fname`, `lname`, `city`, `gender`, `dob`, `email`, `phone`, `created_at`,  
`updated_at`) VALUES (NULL, 'Devarshi', 'Mer', 'rajkot', 'male', '2007-01-12', 'demo@gmail.com',  
'9998889990', current_timestamp(), current_timestamp());
```

Auto increment id will be continue from last record before delete all the data from table

## MySQL TRUNCATE TABLE

The `TRUNCATE TABLE` statement is used to delete the data inside a table, but not the table itself.

### Syntax

`TRUNCATE TABLE table_name;`

```
TRUNCATE TABLE students_1
```

```
INSERT INTO `students_1` (`id`, `fname`, `lname`, `city`, `gender`, `dob`, `email`, `phone`, `created_at`,  
`updated_at`) VALUES (NULL, 'Devarshi', 'Mer', 'rajkot', 'male', '2007-01-12', 'demo@gmail.com',  
'9998889990', current_timestamp(), current_timestamp());
```

# MySQL ALTER TABLE Statement

## MySQL ALTER TABLE Statement

The `ALTER TABLE` statement is used to add, delete, or modify columns in an existing table.

The `ALTER TABLE` statement is also used to add and drop various constraints on an existing table.

### ALTER TABLE - ADD Column

To add a column in a table, use the following syntax:

```
ALTER TABLE table_name  
ADD column_name datatype;
```

```
ALTER TABLE users add COLUMN userpassword varchar(64)
```

### ALTER TABLE - DROP COLUMN

To delete a column in a table, use the following syntax (notice that some database systems don't allow deleting a column):

```
ALTER TABLE table_name  
DROP COLUMN column_name;
```

```
ALTER TABLE users drop column userpassword
```

```
ALTER TABLE users add column userpassword varchar(64) after email;
```

### ALTER TABLE - MODIFY COLUMN

To change the data type of a column in a table, use the following syntax:

```
ALTER TABLE table_name  
MODIFY COLUMN column_name datatype;
```

```
ALTER TABLE users MODIFY COLUMN fname varchar(32)
```

```
ALTER TABLE users add COLUMN dob date
```

```
ALTER TABLE users CHANGE dob date_of_Birth date
```

## DROP COLUMN Example

Next, we want to delete the column named "DateOfBirth" in the "Persons" table.

We use the following SQL statement:

Example

```
ALTER TABLE Persons
```

```
DROP COLUMN DateOfBirth;
```

```
ALTER TABLE users DROP COLUMN date_of_Birth
```

# MySQL Constraints

SQL constraints are used to specify rules for data in a table.

---

## Create Constraints

Constraints can be specified when the table is created with the `CREATE TABLE` statement, or after the table is created with the `ALTER TABLE` statement.

Syntax

```
CREATE TABLE table_name (  
    column1 datatype constraint,  
    column2 datatype constraint,  
    column3 datatype constraint,  
    ....  
);
```

## MySQL Constraints

SQL constraints are used to specify rules for the data in a table.

Constraints are used to limit the type of data that can go into a table. This ensures the accuracy and reliability of the data in the table. If there is any violation between the constraint and the data action, the action is aborted.

Constraints can be column level or table level. Column level constraints apply to a column, and table level constraints apply to the whole table.

The following constraints are commonly used in SQL:

- [NOT NULL](#) - Ensures that a column cannot have a NULL value
- [UNIQUE](#) - Ensures that all values in a column are different
- [PRIMARY KEY](#) - A combination of a `NOT NULL` and `UNIQUE`. Uniquely identifies each row in a table
- [FOREIGN KEY](#) - Prevents actions that would destroy links between tables
- [CHECK](#) - Ensures that the values in a column satisfies a specific condition
- [DEFAULT](#) - Sets a default value for a column if no value is specified
- [CREATE INDEX](#) - Used to create and retrieve data from the database very quickly
